

**AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**LISTING OF CLAIMS:**

1. (Currently Amended) An injection mould which has an ejector arrangement (1) comprising ejectors (7) which, in parting of mould halves (2a, 2b) included in the mould, are adapted to eject a component (15) formed therein, and a pressure plate (30) for actuating the ejectors (7), characterised in that wherein the ejectors (7) in their non-actuated state are completely, or essentially completely, received in ducts (3) formed in a first of said mould halves (2a) and the pressure plate (30) has press pins (31) which, in parting of the mould halves (2a, 2b), are adapted to apply a force to the ejectors (7) to cause said ejection.
2. (Currently Amended) An injection mould as claimed in claim 1, in which the end of each ejector (7) facing the pressure plate (30) has a profile that allows non-rotational anchoring for cooperation with a complementary profile arranged in a locking plate (21), thereby preventing the ejector (7) from being turned.
3. (Currently Amended) An injection mould as claimed in claim 2, in which the end of each ejector (7) facing the pressure plate (30) has a non-rotationally symmetrical profile.

4. (Currently Amended) An injection mould as claimed in claim 1, in which the duct (3) extends from a cavity (4) arranged in the mould and through the locking plate (21).

---

5. (Currently Amended) An injection mould as claimed in claim 1, in which the ducts (3) accommodate resetting means (6) for resetting the position of the ejectors after actuation.

6. (Currently Amended) An injection mould as claimed in claim 5, in which the resetting means (6) consist of springs.

7. (Currently Amended) An injection mould as claimed in claim 1, in which the end of each ejector (7) facing the component (15) forms part of the boundary surface of the cavity (4).

8. (Currently Amended) An injector arrangement (1) of an injection mould, comprising ejectors (7) which, in parting of mould halves (2a, 2b) included in the mould, are adapted to eject a component (15) formed therein, and a pressure plate (30) for actuation of the ejectors (7), characterised in that wherein the ejectors (7) in their non-actuated state are completely, or essentially completely, received in ducts (3) formed in the mould, and the pressure plate (30) has press pins (31) which, in parting of the mould halves (2a, 2b), are adapted to apply a force to the ejectors (7) to cause said ejection.

9. (Currently Amended) An injection mould, characterised in that it is made up of modules, comprising a mould module ~~(50)~~ having a cavity ~~(4)~~, an ejector module ~~(40)~~ accommodating ejectors ~~(7)~~ and resetting means ~~(6)~~, a module comprising the locking plate ~~(21)~~, and a module comprising the pressure plate ~~(30)~~.

10. (Currently Amended) An injection mould as claimed in claim 9, in which the ejectors ~~(7)~~ in their non-actuated state are essentially received in ducts ~~(3)~~ formed in the mould module ~~(50)~~ and the ejector module ~~(40)~~, and the pressure plate ~~(30)~~ has press pins ~~(31)~~ which, in parting of the mould, are adapted to apply a force to the ejectors ~~(7)~~ to cause said ejection.
